This report draws on a prior study:

Swaminathan A, Kim R, Xu Y, Blossom J.C., Joe W, Venkataramanan R, Kumar A, & Subramanian S.V. Burden of Child Malnutrition in India: A View from Parliamentary Constituencies. Economic & Political Weekly. 2018; In press.

Background

Ensuring adequate nutrition and promoting optimal growth potential in early childhood has important implications for cognitive development, economic productivity in adulthood, and long-term health (1, 2). There is a great degree of momentum at the highest levels of the Central government in India to accelerate reduction in nutritional deprivation among children, as exemplified by the Government of India's (GOI) National Nutrition Mission (NNM) and the National Institution for Transforming India's (NITI Aayog) National Nutrition Strategy (NNS), also known as POSHAN Abhiyaan (3). The program, among others, explicitly aims to improve targeting mainly via identification of high burden districts, also referred to as the Aspirational Districts (4). In India, districts are the smallest administrative unit at which demographic data are consistently collected. Consequently, top attention is given to monitoring of the key development indicators at this level.

Importance of Parliamentary Constituencies

The policy discourse around nutritional issues is increasingly being driven by data, in part due to the availability as well as the perceived necessity to collect data, at the district level. At the same time, for real impact and action, political will and support is critical to the success of any public policy. Yet, data pertaining to key development indicators do not exist at the level of Parliamentary Constituency (PC) – the unit at which political discourse and action takes place.

There are 543 Parliamentary Constituencies in India as per the PC boundary map from 2014 (5); each represented by a Member of Parliament (MP) who represents the population residing in the constituency in the Lok Sabha (Lower House of the Indian Parliament). The MPs of the Lok Sabha are elected by first-past-the-post universal adult suffrage and serve 5-year terms. Unlike districts that do not have any direct accountability, PCs are dynamic with the representatives being accountable for the vision and implementation at the national and the specific constituency level. For the MPs to function effectively, development indicators need to be available at the PC level. To our knowledge, none exist in a systematic manner, which leads to a disconnect between the public policy and political discourse on matters population health and well-being.

Objectives

In this brief report, and building on a previous study (6), for the first time, we present robust estimates on five indicators of child malnutrition (*i.e.*, stunting, underweight, wasting, low birth weight, anaemia) for each PC in India. We provide ranking of the PCs both on the (i) average prevalence of the five indicators; and (ii) the degree of “Between-Village” inequality in the prevalence estimate on the five indicators. Thus, even if a PC is doing well on average, large inequalities within a PC (between its villages) suggests the need for further precision geo-targeting.

Indicators of Child Malnutrition

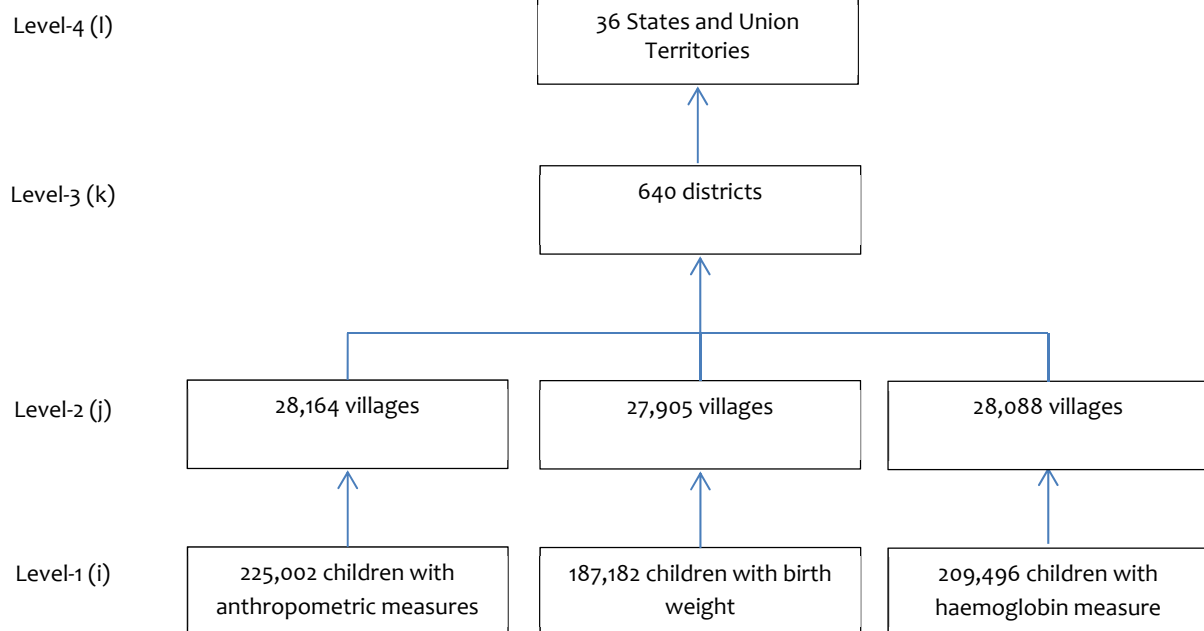

We focus on the following five indicators of child malnutrition that are identified by the NITI Aayog as ‘monitorable targets’ (3) and also being tracked for the Sustainable Development Goals (7).

	Definition from NFHS-4 (8)	National and International Goals
Stunting	Height-for-age is a measure of linear growth retardation and cumulative growth deficits. Children whose height-for-age Z-score is below minus two standard deviations (-2 SD) from the median of the reference population are considered short for their age (stunted), or chronically undernourished.	NNM targets to reduce stunting by 2% per annum. The Mission would strive to achieve reduction in stunting from 38.4% (NFHS-4) to 25% by 2022 (Mission 25 by 2022).
Underweight	Weight-for-age is a composite index of height-for-age and weight-for-height. It takes into account both acute and chronic undernutrition. Children whose weight-for-age Z-score is below minus two standard deviations (-2 SD) from the median of the reference population are classified as underweight.	NNM targets to reduce underweight by 2% per annum. NNS targets to prevent and reduce the prevalence of underweight in children (0- 3 years) by 3% per annum from NFHS 4 levels by 2022.
Wasting	Weight-for-height index measures body mass in relation to body height or length and describes current nutritional status. Children whose Z-score is below minus two standard deviations (-2 SD) from the median of the reference population are considered thin (wasted), or acutely undernourished.	Sustainable Development Goal 2.2 targets to reduce wasting to 5% by 2025 and end all forms of malnutrition by 2030.
Low birth weight	For all live births in the five years before the survey that have a reported birth weight, either from a written record or mother’s report, low birth weight was defined as less than 2.5 kg regardless of gestational age.	NNM targets to reduce underweight by 2% per annum.
Anaemia	Anaemia is a condition that is marked by low levels of haemoglobin in the blood. Children with haemoglobin levels below 11.0 g/dl were considered to be anaemic.	NNM targets to reduce anemia (among young children, women and adolescent girls) by 3% per annum. NNS targets to reduce the prevalence of anemia among young children, adolescent girls and women in the reproductive age group (15- 49 years) by one third of NFHS 4 levels by 2022.

Methodology

We use data from the 2016 National Family Health Survey (NFHS-4) (8) to compute prevalence estimates as well as inequalities in the prevalence estimates between villages within a PC on the five indicators of child malnutrition. In this report, we define ‘villages’ as the primary sampling units (or clusters) sampled in the NHFS-4.

STEP 1: Obtain data on children under 5 years for the five indicators from NFHS-4 (2016) with the following data structure

STEP 2: Estimate village-specific precision-weighted probability for each indicator

For each indicator, we ran a four-level random effects logit model with child i nested within village j , district k , and state l . Random effects model provides a technically robust and efficient framework to account for the complex survey design and produce precision-weighted estimates for units of interest (9, 10). The precision-weighted estimates for each village account for sampling variability as well as the hierarchical membership of villages nested within districts within states. Multilevel modeling was performed in the MLwiN 3.0 software program via Monte Carlo Markov Chain (MCMC) methods using Gibbs sampler with non-informative priors, a burn-in of 500 cycles, and monitoring of 5,000 iterations of chains (11).

Step 3: Link all villages to PCs using GPS coordinates

All villages were directly linked to PCs based on GPS coordinates available for sampling cluster locations. This methodology was demonstrated in a prior study (6). In the DHS geographic data, the center of the populated place of each cluster was recorded with a GPS receiver. These locations were listed in degrees of latitude and longitude. We generated a GIS map of cluster points using the latitude-longitude coordinates and the ArcGIS Add Data from the XY Coordinates tool. We then combined this map with the PC boundary map using the ArcGIS spatial join tool to determine which PC each village falls into.

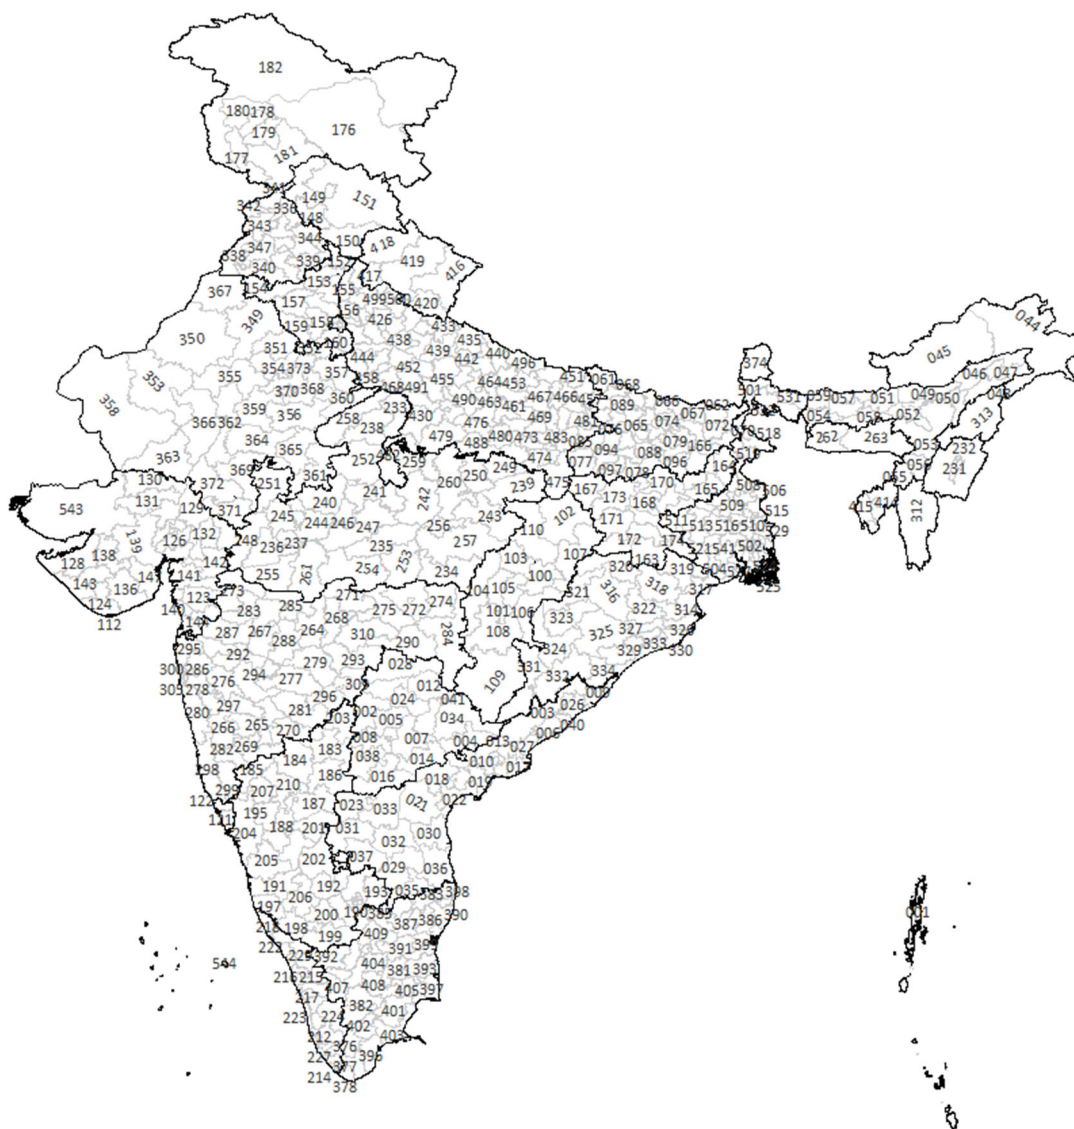

Step 4: Aggregate village-specific estimates to get prevalence and between-village inequality for each PC

Finally, all village-specific predictions were aggregated to calculate the mean prevalence and between-village inequality (as measured by standard deviation (SD)) for each PC.

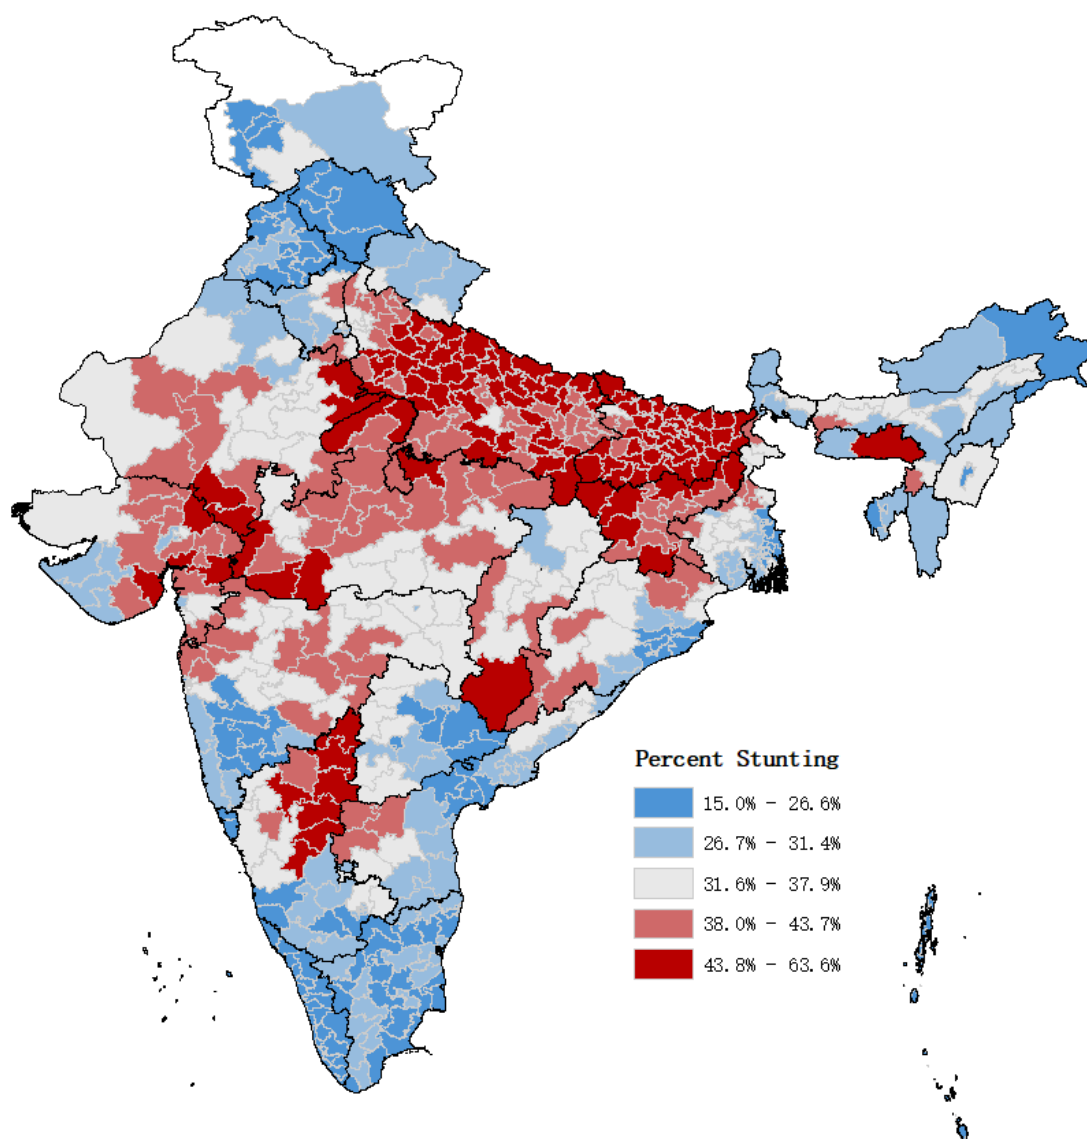

In the following pages we present (i) maps of the prevalence estimates in the five child malnutrition indicators across 543 PCs (Maps 1-a to 5-a); (ii) maps of the between-village inequality in the five child malnutrition indicators across 543 PCs (Maps 1-b to 5-b); (iii) maps classifying 543 PCs based on combinations of the two measures of distribution (i.e., prevalence estimates and between-village inequality above or below the overall mean and SD, respectively) (Maps 1-c to 5-c); (iv) correlation between the prevalence estimates of the five indicators (Table 1); and (v) the ranking of PCs by the prevalence estimates and between-village inequality for the five indicators (Tables 2, 3).

Index Map of 543 Parliamentary Constituencies (Census ID*) in India, 2016

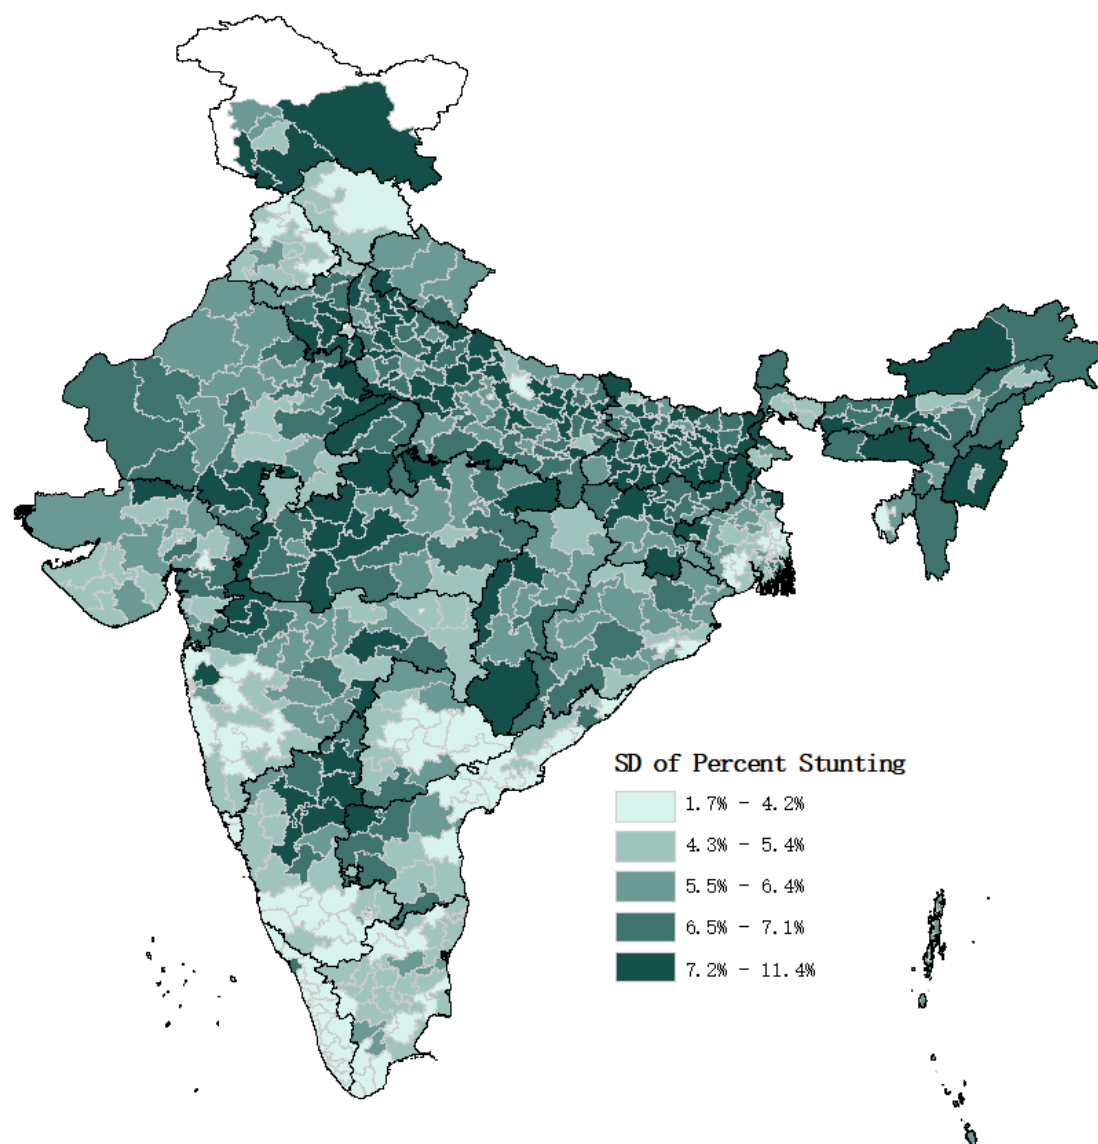

* The names for all parliamentary constituencies can be found in Table 2 and 3.

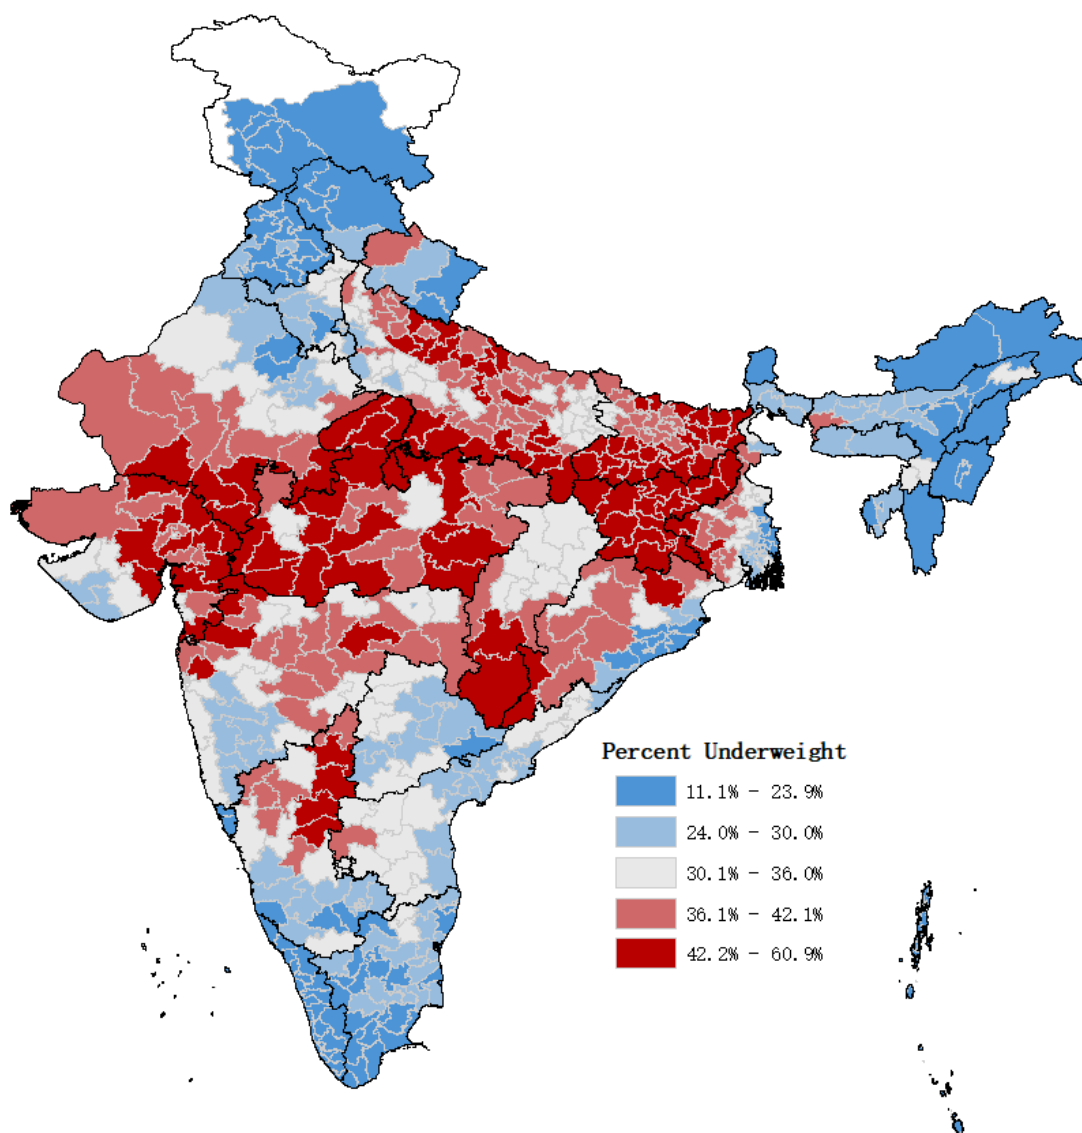

Map 1-b. Between-Village Inequality (in Standard Deviation [SD]) in Prevalence Estimates of Stunting in 543 Parliamentary Constituencies

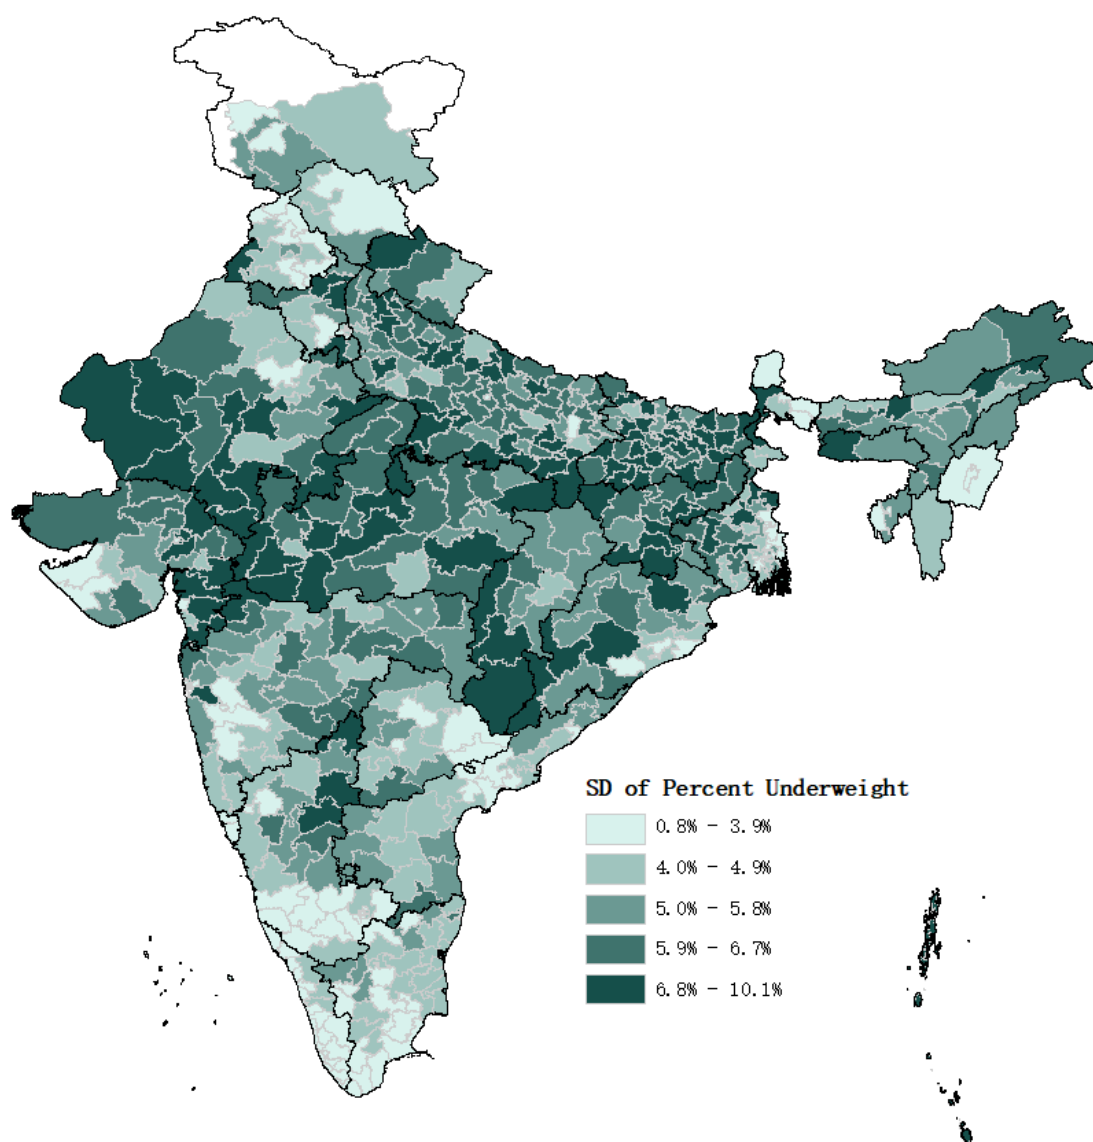

Map 1-c. Typology of Parliamentary Constituencies based on Combinations of Prevalence Estimates (Above and Below the Overall Mean) and Between-Village Inequality (Above and Below the Overall SD) in Stunting

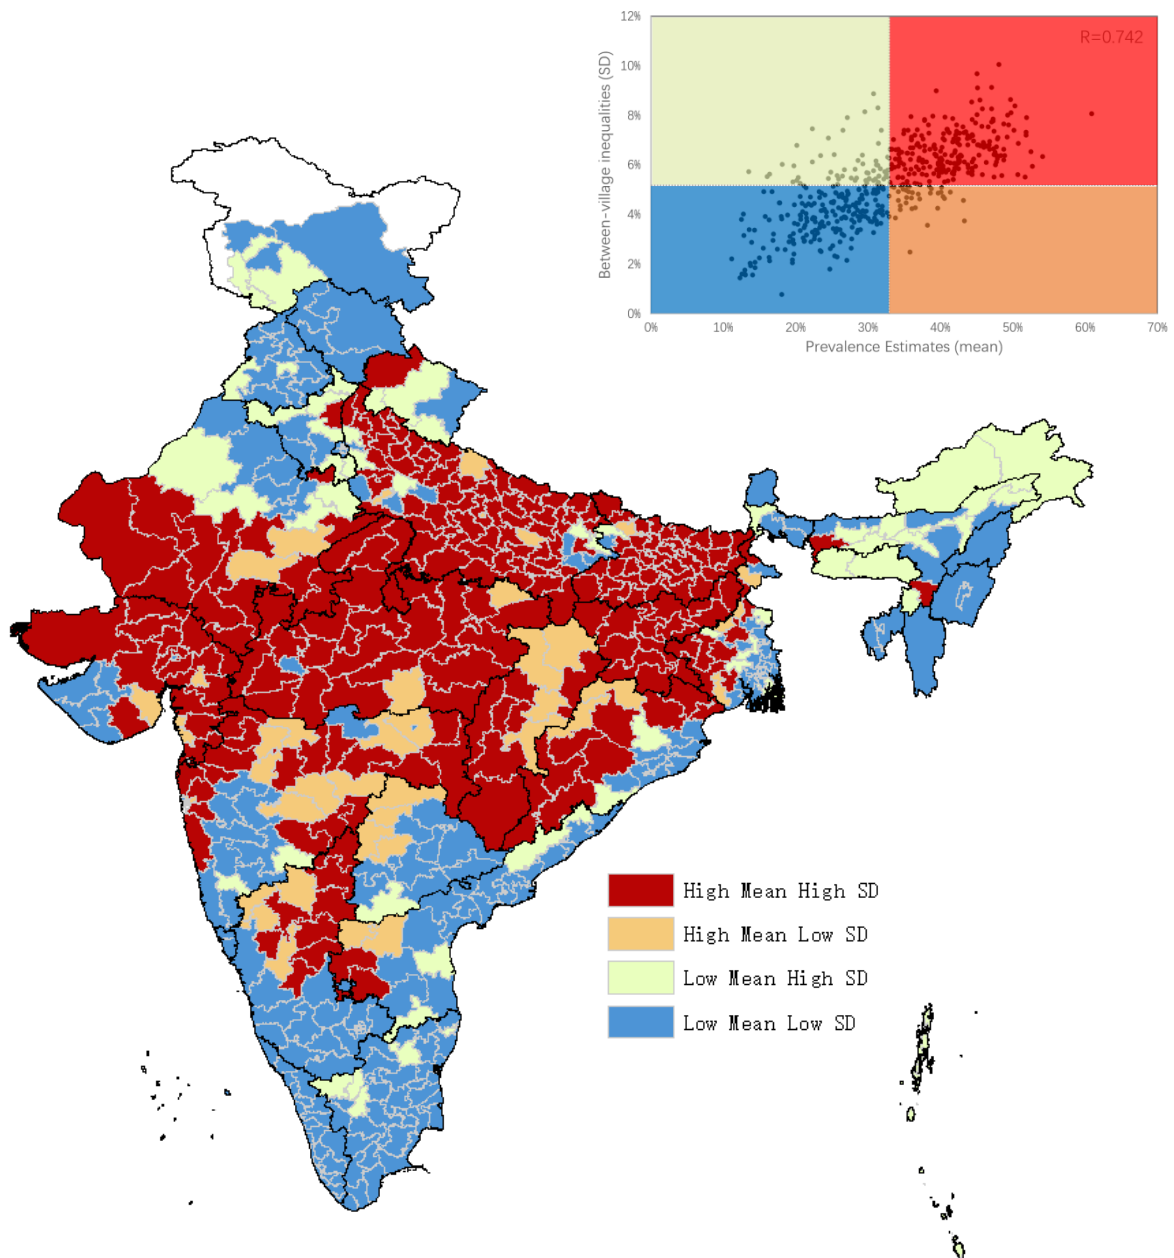

Map 2-a. Prevalence Estimates of Underweight in 543 Parliamentary Constituencies

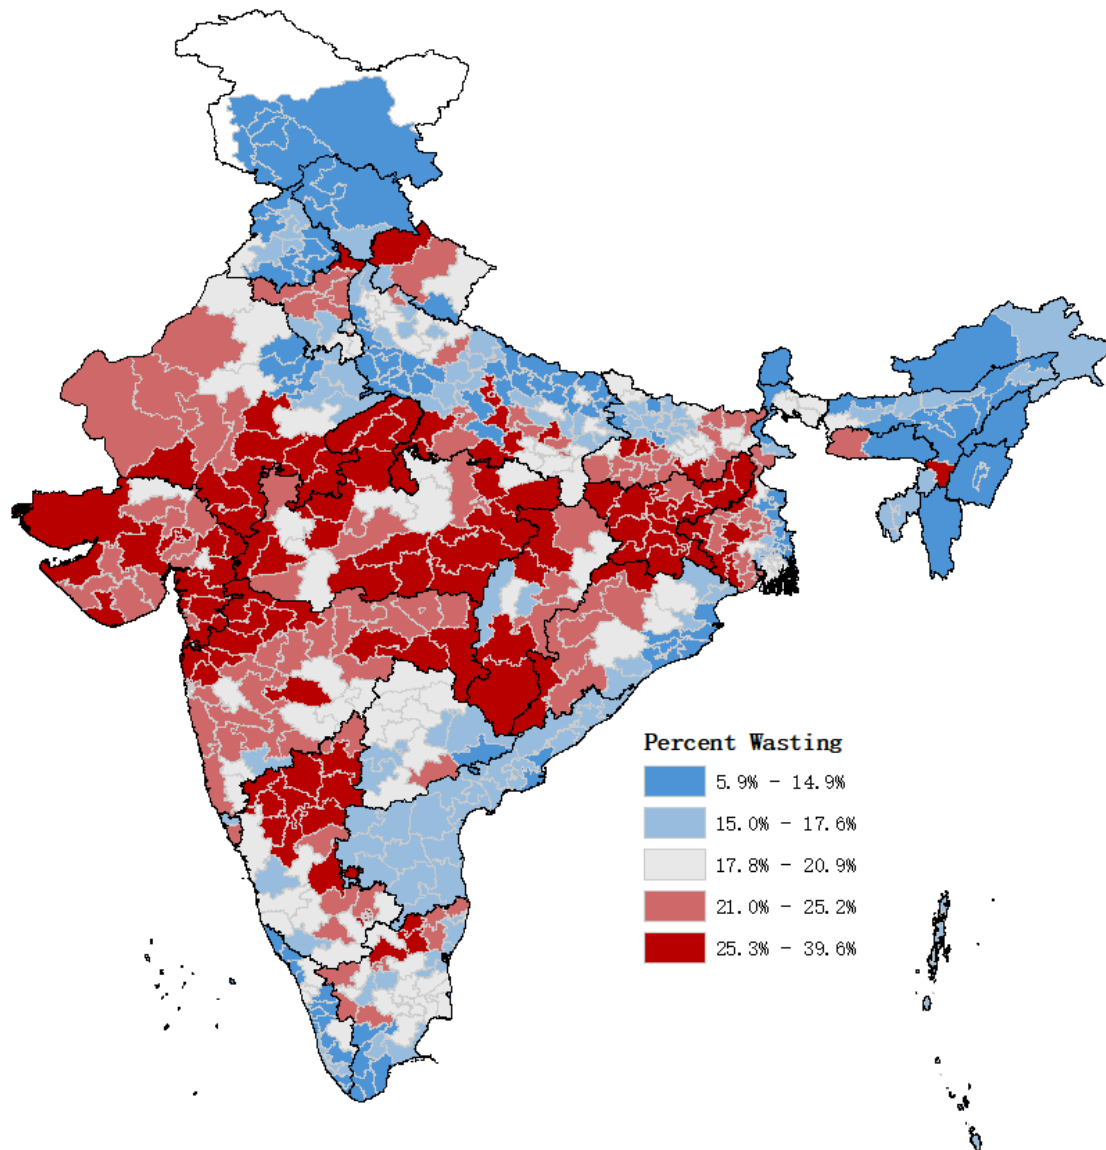

Map 2-b. Between-Village Inequality (in Standard Deviation [SD]) in Prevalence Estimates of Underweight in 543 Parliamentary Constituencies

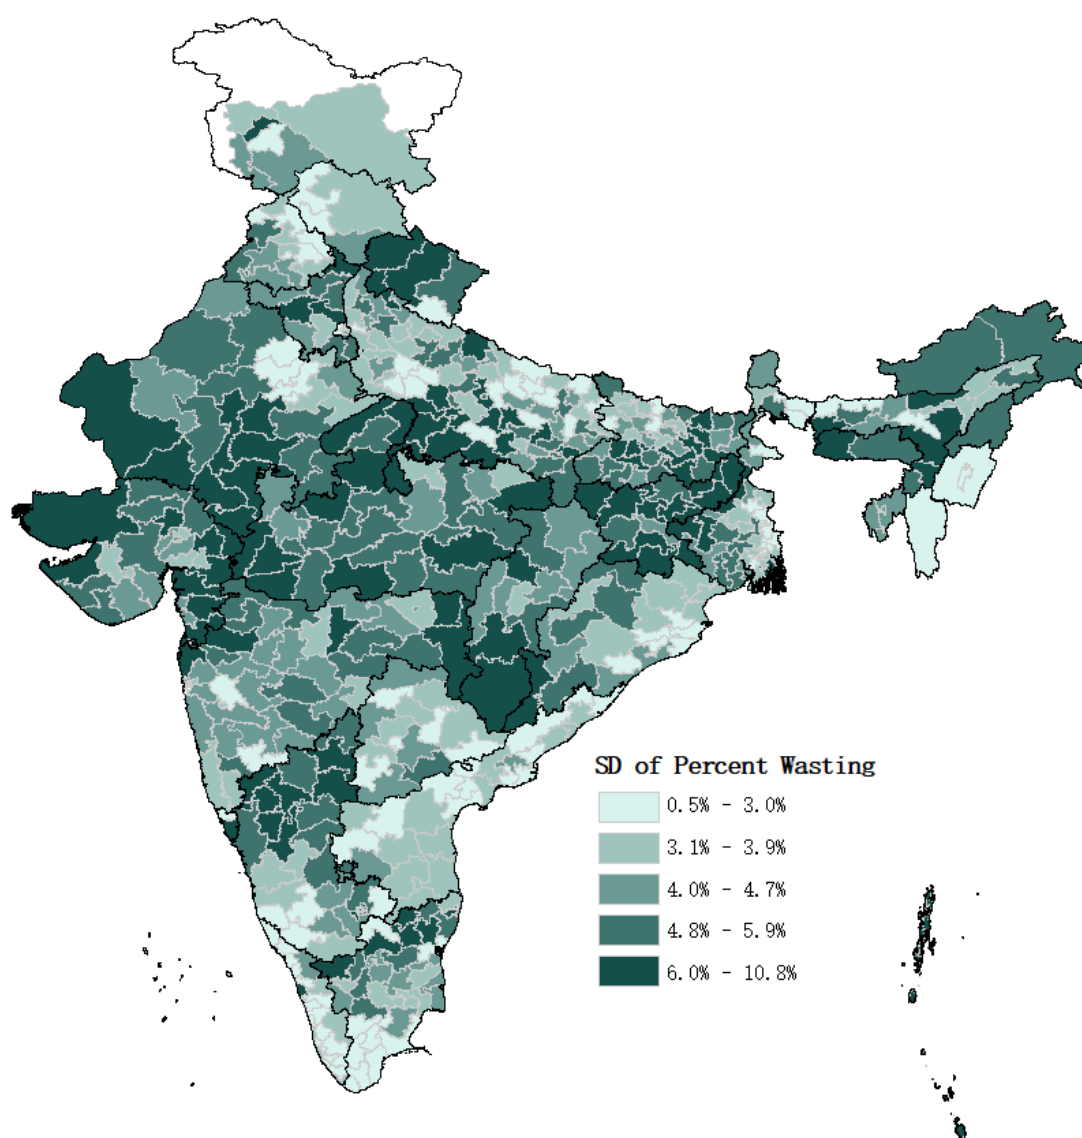

Map 2-c. Typology of Parliamentary Constituencies based on Combinations of Prevalence Estimates (Above and Below the Overall Mean) and Between-Village Inequality (Above and Below the Overall SD) in Underweight

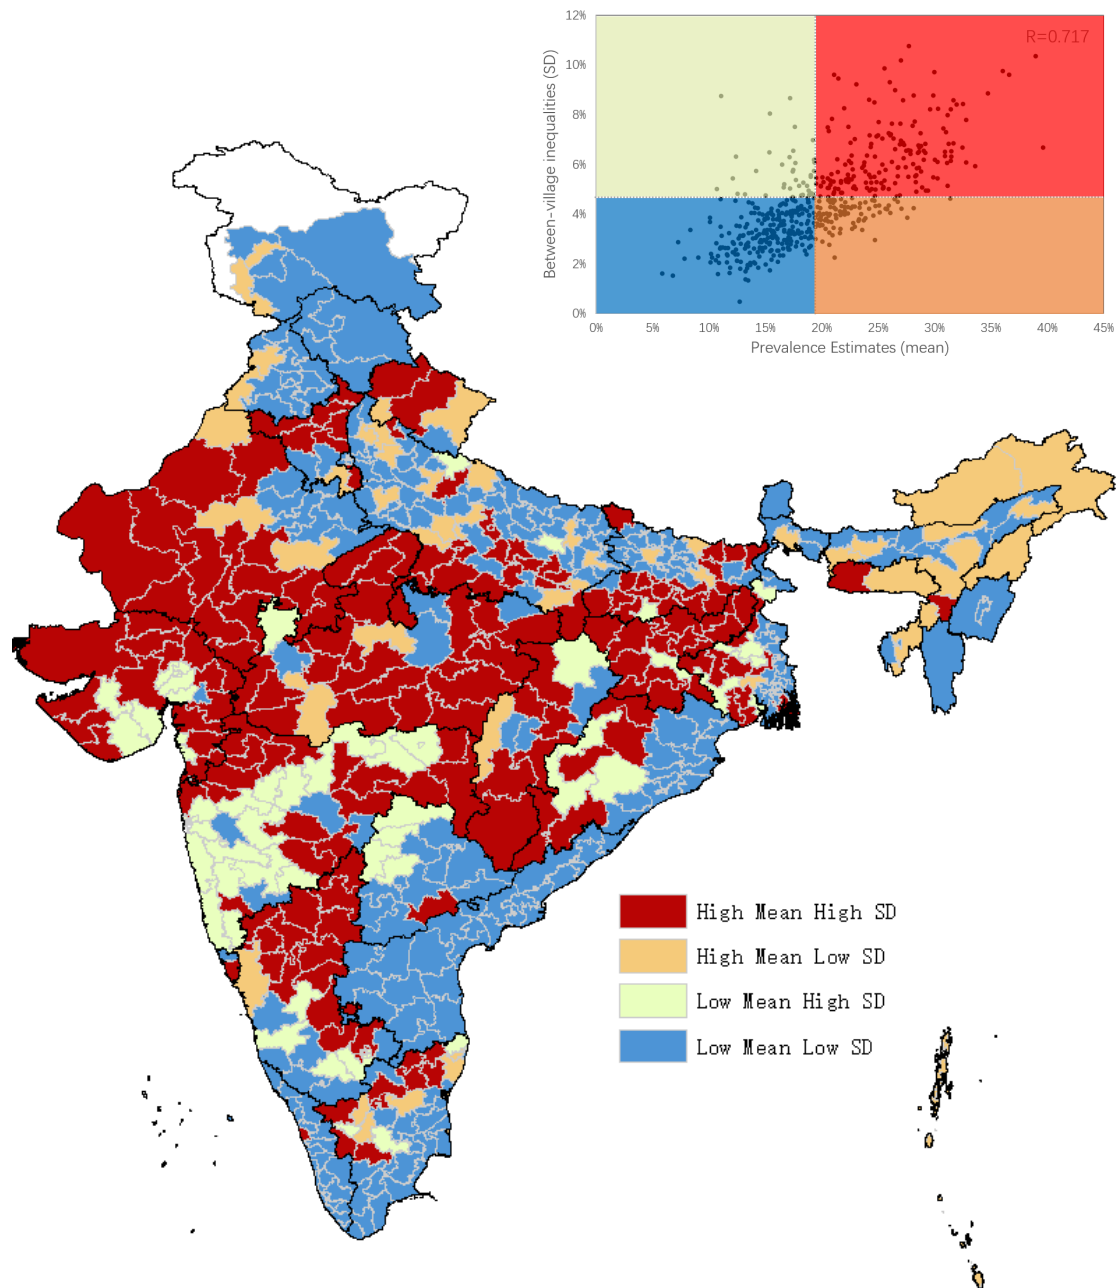

Map 3-a. Prevalence Estimates of Wasting in 543 Parliamentary Constituencies

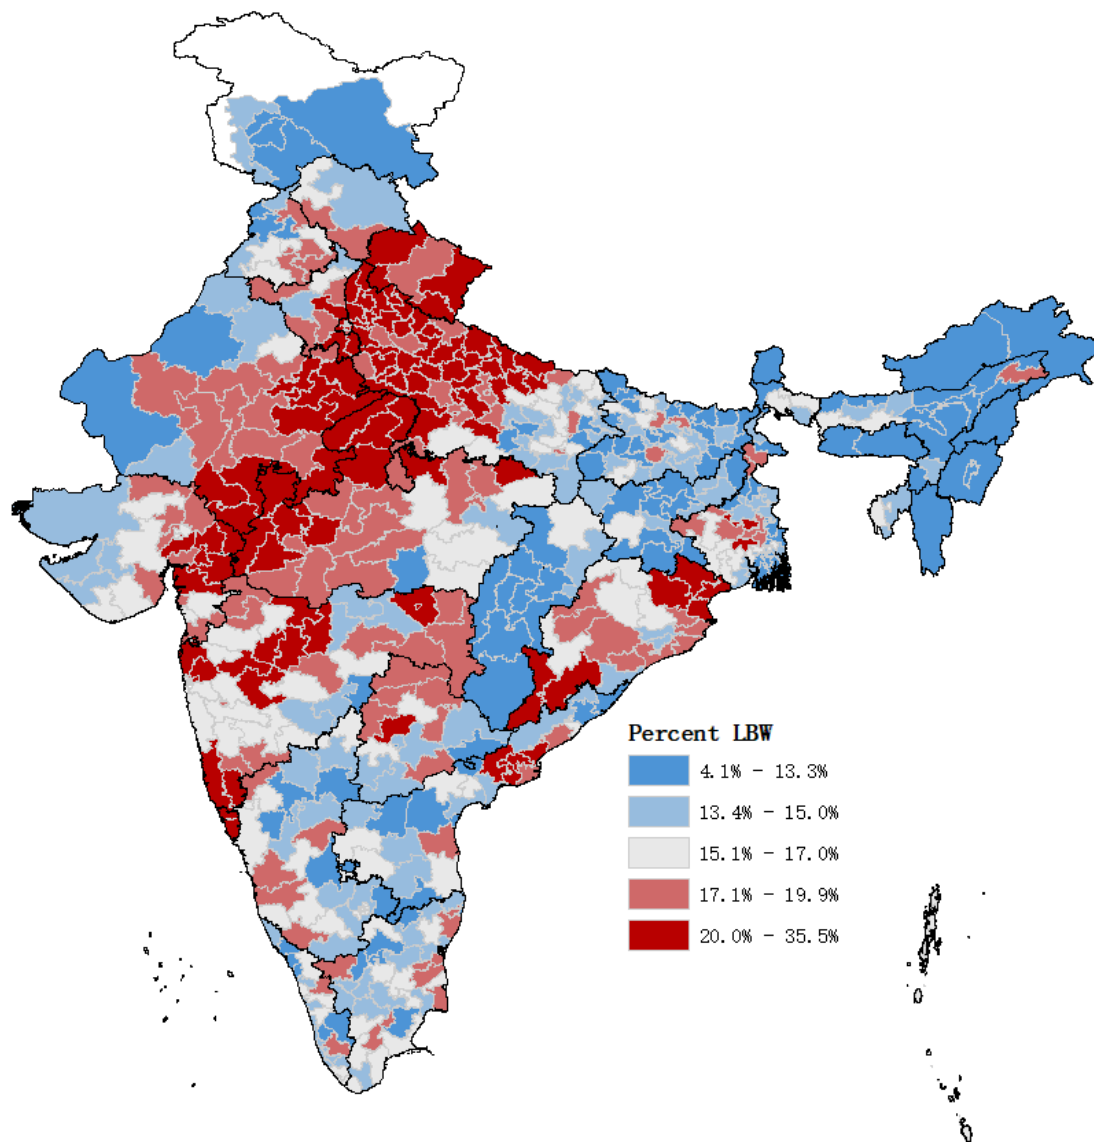

Map 3-b. Between-Village Inequality (in Standard Deviation [SD]) in Prevalence Estimates of Wasting in 543 Parliamentary Constituencies

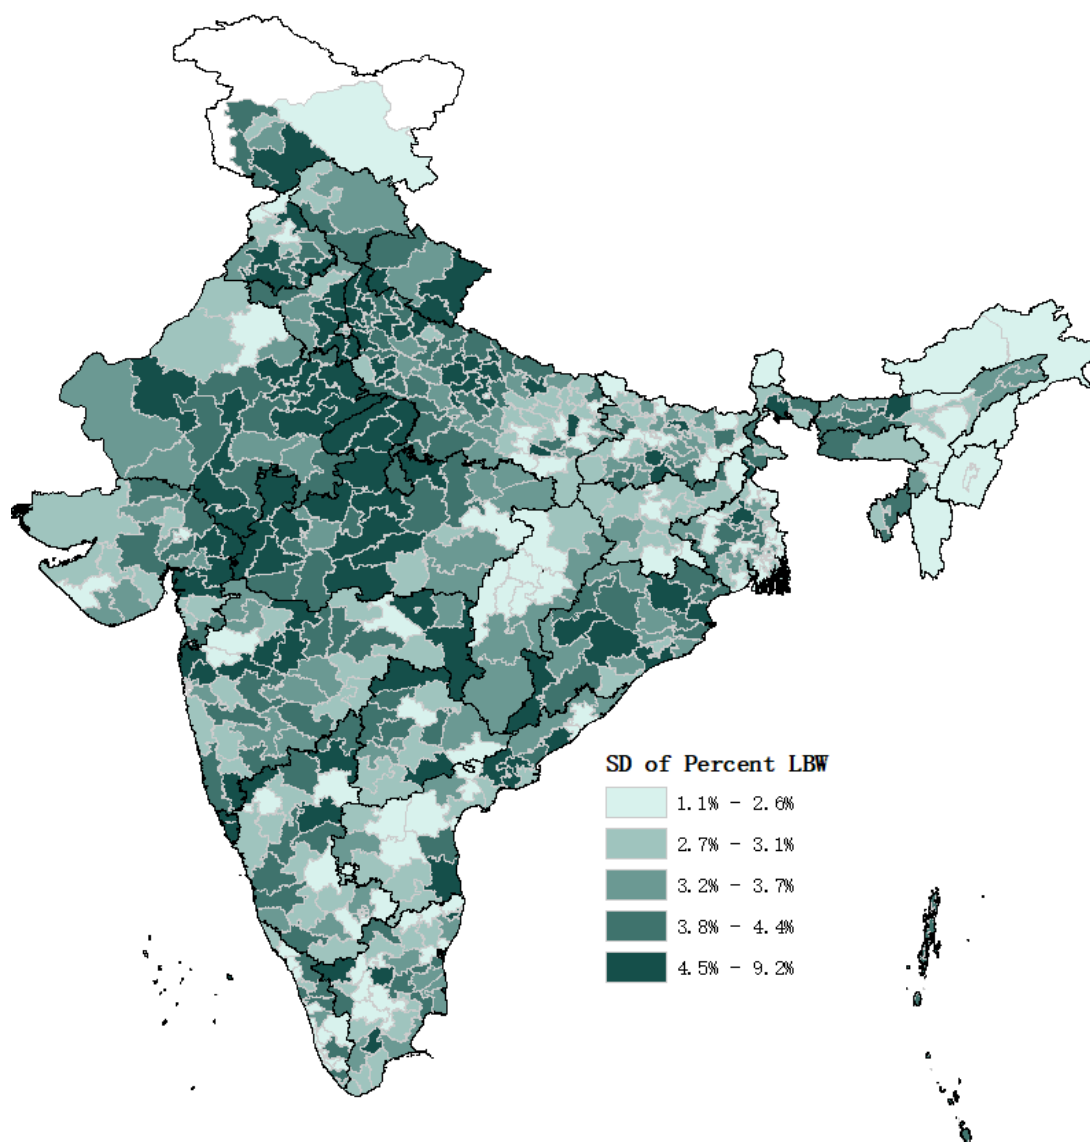

Map 3-c. Typology of Parliamentary Constituencies based on Combinations of Prevalence Estimates (Above and Below the Overall Mean) and Between-Village Inequality (Above and Below the Overall SD) in Wasting

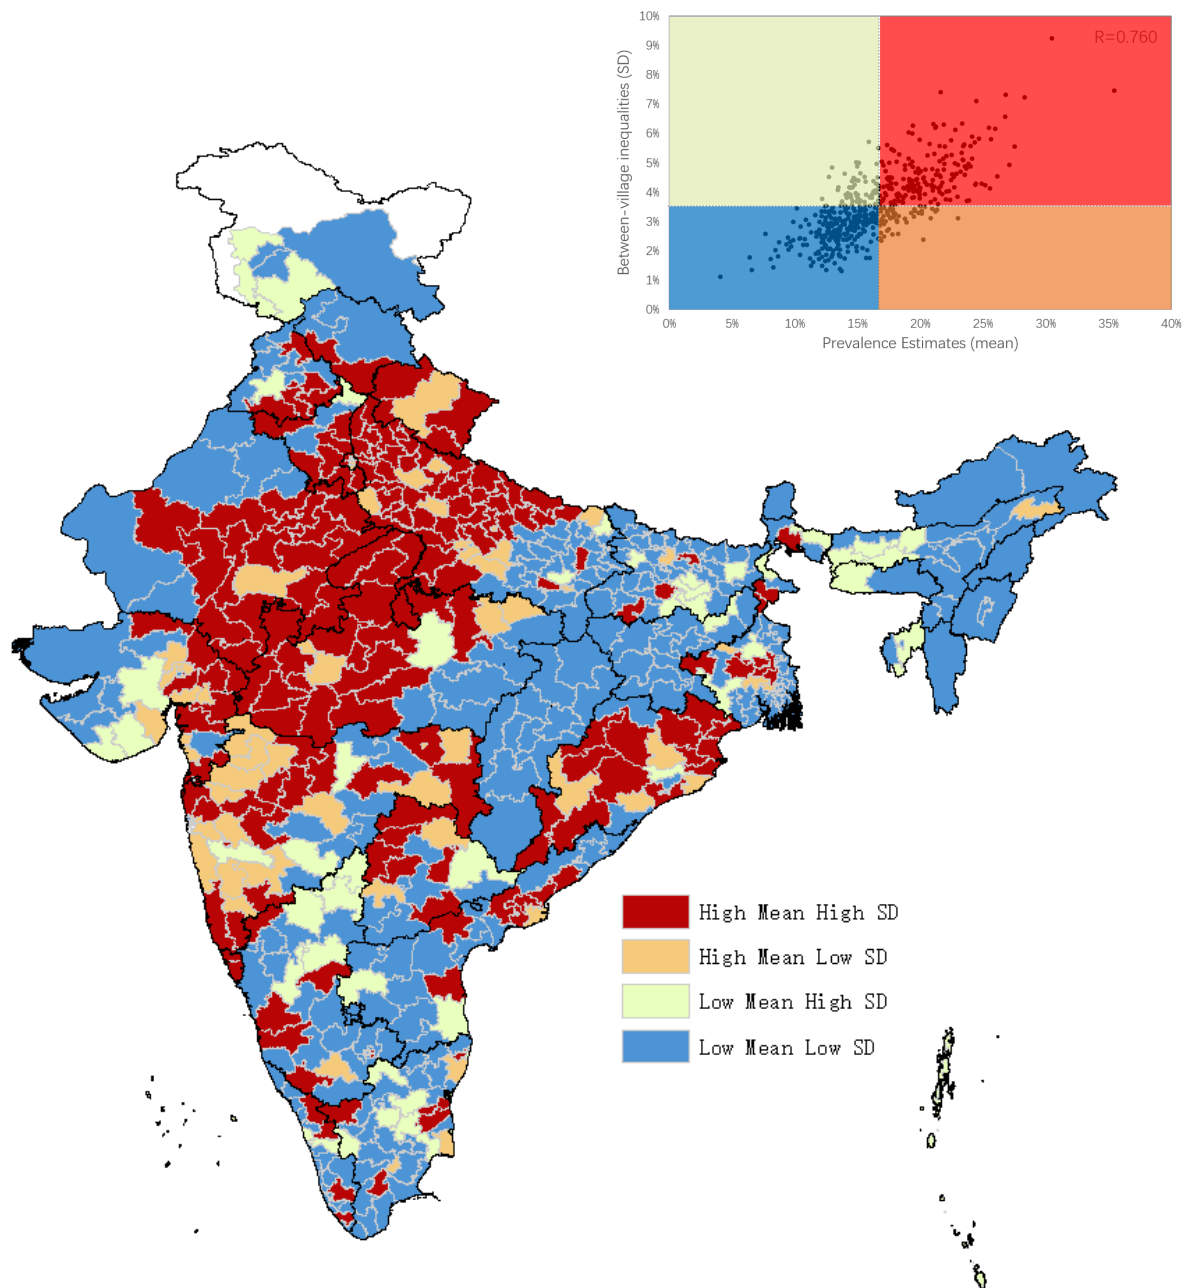

Map 4-a. Prevalence Estimates of Low Birth Weight in 543 Parliamentary Constituencies

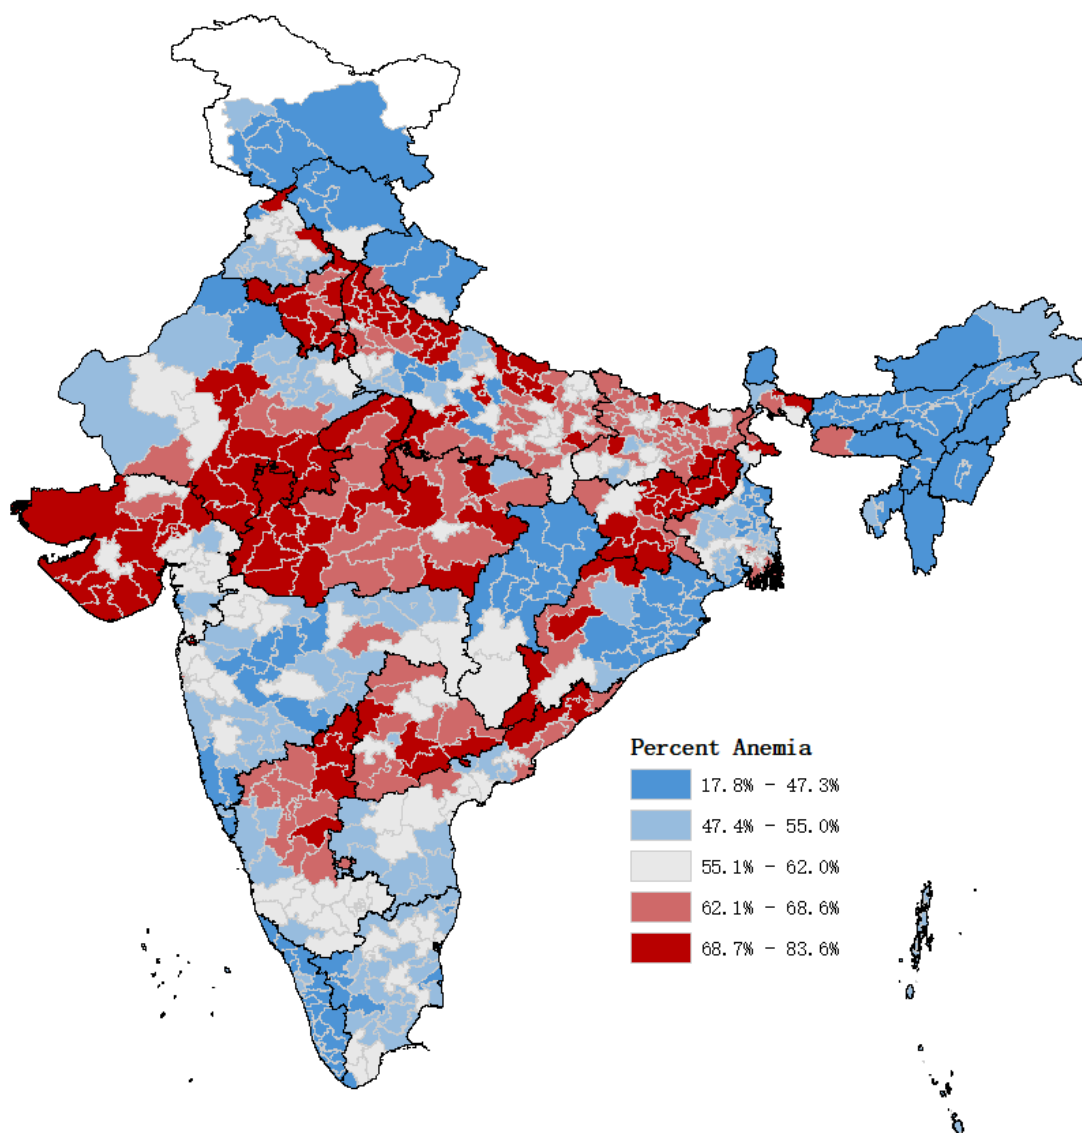

Map 4-b. Between-Village Inequality (in Standard Deviation [SD]) in Prevalence Estimates of Low Birth Weight in 543 Parliamentary Constituencies

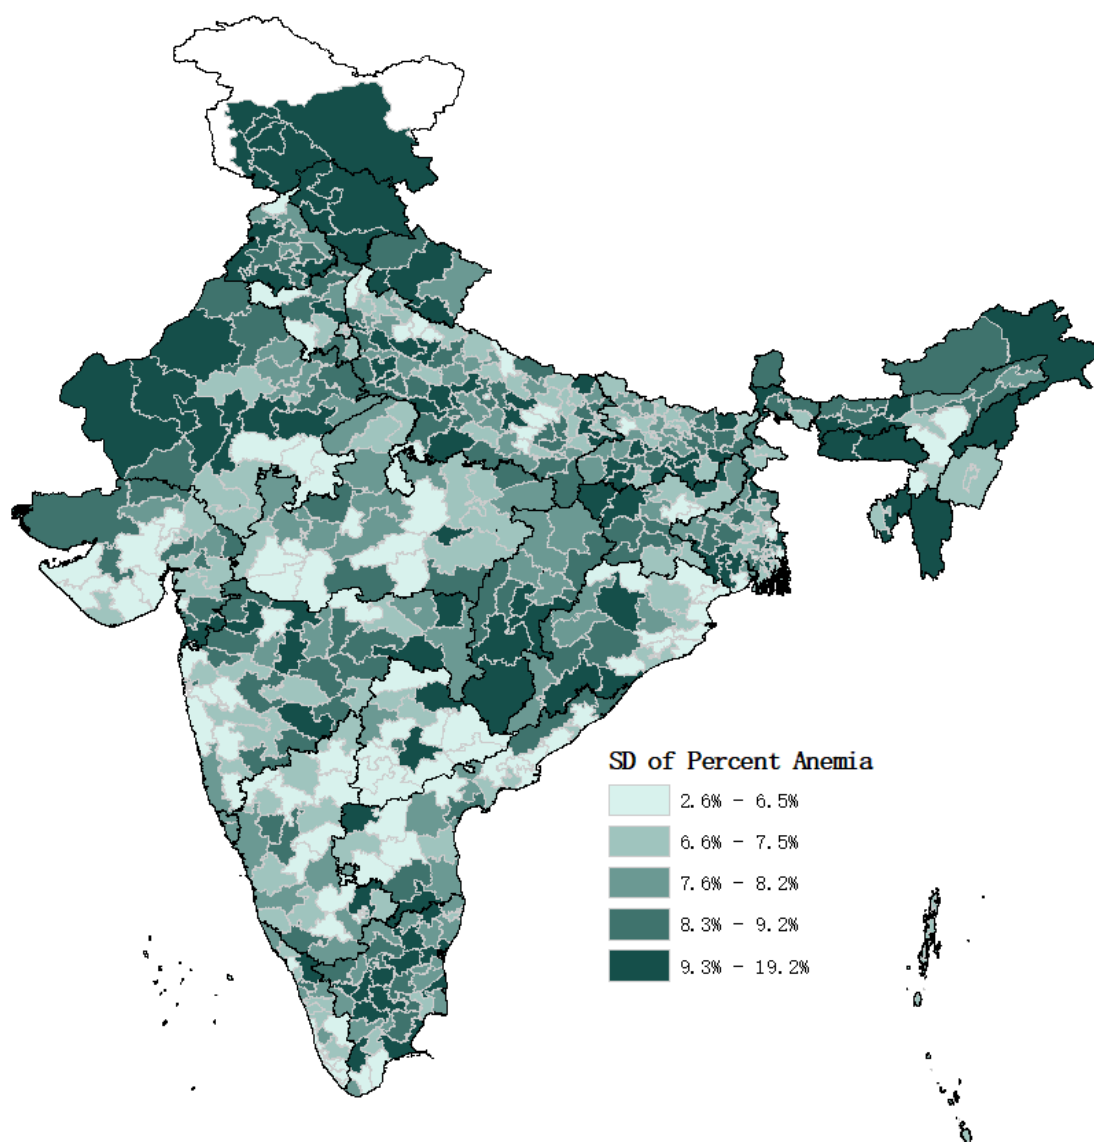

Map 4-c. Typology of Parliamentary Constituencies based on Combinations of Prevalence Estimates (Above and Below the Overall Mean) and Between-Village Inequality (Above and Below the Overall SD) in Low Birth Weight

Map 5-a. Prevalence Estimates of Anaemia in 543 Parliamentary Constituencies

Map 5-b. Between-Village Inequality (in Standard Deviation [SD]) in Prevalence Estimates of Anaemia in 543 Parliamentary Constituencies

Map 5-c. Typology of Parliamentary Constituencies based on Combinations of Prevalence Estimates (Above and Below the Overall Mean) and Between-Village Inequality (Above and Below the Overall SD) in Anaemia

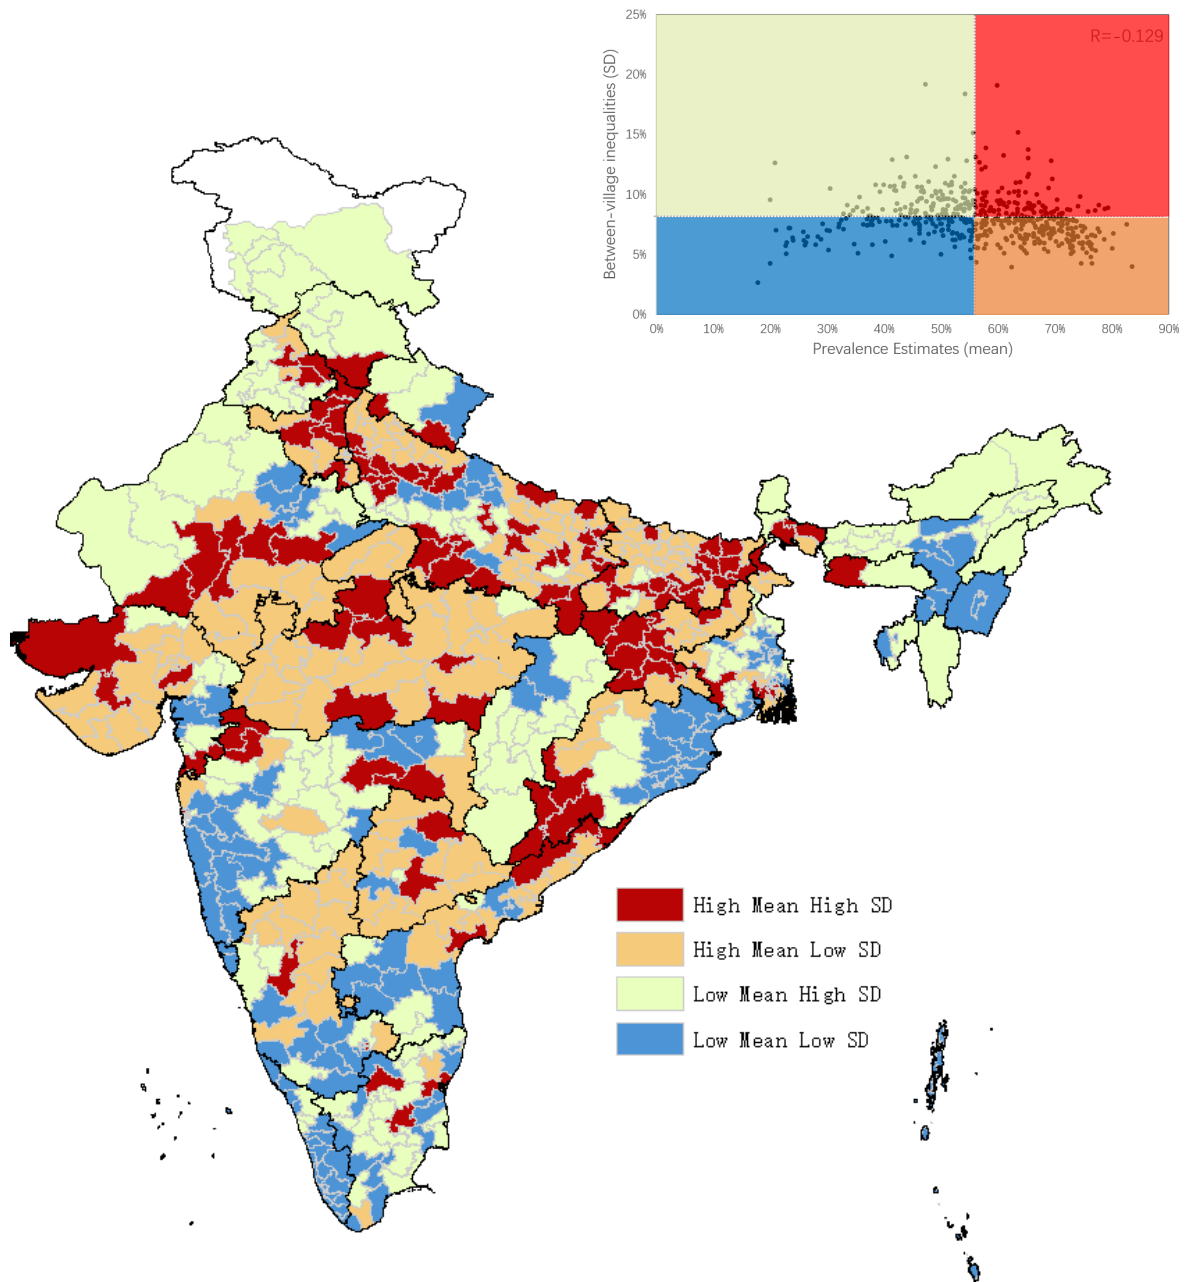

Table 1. Correlation between the Prevalence Estimates of Child Malnutrition Indicators across 543 Parliamentary Constituencies

	Stunting	Underweight	Wasting	Low birth weight	Anaemia
Stunting	1.000				
Underweight	0.840	1.000			
Wasting	0.231	0.627	1.000		
Low birth weight	0.191	0.205	0.055	1.000	
Anaemia	0.454	0.550	0.406	0.221	1.000

	High correlation >0.75
	Moderate correlation 0.5-0.74
	Weak correlation 0.25-0.49
	Very weak correlation <0.25

Table 2. Prevalence Estimates and Ranks for the Five Indicators of Child Malnutrition across 543 Parliamentary Constituencies, India 2016
(Note: Ranked from the highest (1) to the lowest (543) prevalence)

ID	State	Parliamentary Constituency (PC)	Stunting		Underweight		Wasting		Low birth weight		Anaemia
